WorkFlex

CASE STUDY BRIEFING

Applied AI Engineer

Welcome

...to WorkFlex, where we are revolutionizing the workplace by enabling employees to work from anywhere without any compliance risks!

Congrats to making it to the next step, a case study! Please read this briefing to be optimally prepared for the case study.

The next step: Case Study

How the challenge will work

You will have 90 minutes to complete the exercise. This will be an open-book challenge, so feel free to use any LLMs, online resources, frameworks and libraries you need. There are no rules which technologies you can or cannot use.

15 minutes before scheduled time, you'll receive a ZIP file containing:

- The exercise instructions as a PDF
- A python service inside a docker container which will mock some systems your app will have to connect to

Things to prepare

Please note that we won't provide any starter code or scaffolding. You can set up your project just with Claude, any other coding assistant or any IDE. The app we would like you to build during the coding challenge is a somewhat realistic real-world prototype. It will require:

- some LLM connection, so get your Anthropic, Gemini, or any other API key ready ahead of time
- a little frontend so your non-technical clients have something to see :D
- Docker Compose to be installed on your machine to run the mock-servers we will provide

Make sure you have sufficient tokens for your agent to not run out while in the middle of the challenge.

Submission and review

The coding challenge needs to be submitted in a private GitHub repository and shared with coding-challenge@getworkflex.com. You can already set up the private GitHub ahead of time.

After you complete and submit the coding exercise, our team will review your submission based on:

- Completeness of functionality
- Quality of technical implementation (architecture, extensibility, quality of submitted code, test coverage if any)
- Production-readiness: Could we now put this inside a container and deploy it right away or do we need to do major rework before it would be ready to go live.
