WorkFlex

CASE STUDY

Applied AI Engineer

Welcome

...to WorkFlex, where we are revolutionizing the workplace by enabling employees to work from anywhere without any compliance risks!

We don't believe in standard LeetCode tests because manual coding isn't how we work at WorkFlex. This case study is a 'day-in-the-life' simulation designed to see how you use your AI-native toolkit to navigate the messy grey areas between human departments and technical systems.

Wishing you much success!

Case Study - Overview (90 mins)

The Goal: Build an AI-native agent that turns messy Teams messages into structured Jira tickets (or updates) while pulling real-time business data.

🗒️ The Scenario

Our Product Engineers are overwhelmed by messages in the #feature-requests Teams channel. Currently, a human has to manually check if a request already exists in Jira, look up the client's annual recurring revenue (ARR) in our CRM, and create a ticket. You are building the "Bridge Agent" to automate this.

🛠️ The "Mock" Environment

To save you time, you don't need to connect to real APIs. Instead we provided some Mock APIs which mock Teams, JIRA and Hubspot for you to connect to.

Please check out README.md to see how to start the mock server and how it works.

🤖 Functional Requirements

Your application must use Claude or an equivalent LLM to:

1. Analyze & Extract: Scan the Teams messages. Identify the Requester, the Client Name, and the Core Request.
2. Business Intelligence: cross-reference the client name with the data in Hubspot to attach their ARR to the request.
3. Deduplication Logic: Compare the new request against the data in JIRA.
   - If a match exists: Draft a "comment" for that ticket, adding the new context (who requested it, which client, what was requested).
   - If no match exists: Draft a "New Ticket" with a clear title, summary, ARR, and client name.
4. The "Feedback" Loop: Generate a message to be sent back to the Teams channel saying: "Got it! Added this to Ticket #JIRA-123" or "Created new Ticket #JIRA-999 for Acme Corp ($200k ARR)."

🎨 The UI

Create a simple browser-based interface where an internal admin can:

- Click "Process Messages".
- See a list of what the AI decided to do (Update vs. Create).
- Review the drafted ticket content before it "submits."

📨 Regarding the submission:

- Please submit your results to a private GitHub repository.
- Add coding-challenge@getworkflex.com as a collaborator.
- Please share the link to your private GitHub repository when submitting your solution. This helps us to efficiently match your submission with your application.
- The time limit starts when you receive the challenge files, and no additional commits should be made after the 1.5-hour mark.

Good Luck!
